

IN THE ABSTRACT:

The invention relates to a device for administering or ingesting fluids or powder-type substances (S) for a person, especially medical substances and/or food for children. [[Said]] The device comprises a receiving unit (2) for receiving the substances (s) which are to be administered and a discharge unit (4) which is connected to the receiving unit (2) and which has a discharge opening (8) for discharging the substance (S) to the individual. [[Said]] The device (1) comprises, at least in parts, an outer form which is not functionally related to the administration. The invention also relates to replacement elements for [[said]] the device, in addition to the use of [[said]] the device for administering medicaments and/or food for children.
